

WORKSPACE TOPOLOGY CHANGE DETECTION: BRANCH-STRUCTURED EVIDENCE FOR EMBODIED WORLD-ACTION MODELS

Anonymous authors

Paper under double-blind review

ABSTRACT

We study robot scene understanding. The motivating bet is: Detect topology changes in supports, passages, and occlusions before planning fails.. We introduce a mechanism-level representation that keeps physically admissible but unrealized action outcomes as explicit branches. A synthetic contact-style evaluation shows that the proposed branch mechanism improves hidden-mode success and tail-risk relative to observed-only, augmentation-as-data, and scalar-uncertainty baselines.

1 INTRODUCTION

Robotics papers often collapse unobserved physical alternatives into extra data, variance, or a single predicted next state. For robot scene understanding, this can erase the difference between modes that are visually similar but action-critical. This paper asks whether a world-action model should expose those alternatives to the planner before execution.

2 HOSTILE PRIOR WORK

The closest hostile records include (pri, 2021; 2022; 2026a; 2025a; 2026b; 2025b). They make generic world models, contact prediction, and uncertainty insufficient as novelty claims. Our boundary is narrower: preserve branch-valued contact futures as the planning object.

3 MECHANISM

Given state s and action a , the model returns an observed next-state prediction plus a finite atlas $B(s, a)$ of admissible latent branches. Planning minimizes nominal loss plus adverse-branch tail risk. This is not bigger data or a new benchmark; it changes the object represented by the WAM.

4 EVIDENCE

We include a runnable synthetic testbed in `src/run_experiment.py`. It compares four variants under nominal and hidden-mode-shift conditions.

Variant	Split	Success	Tail risk
observed_only_wam	nominal	0.520	0.480
observed_only_wam	hidden_mode_shift	0.172	0.828
augmentation_as_data_wam	nominal	0.630	0.370
augmentation_as_data_wam	hidden_mode_shift	0.245	0.755
scalar_uncertainty_wam	nominal	0.637	0.363
scalar_uncertainty_wam	hidden_mode_shift	0.352	0.647
proposed_branch_mechanism	nominal	0.760	0.240
proposed_branch_mechanism	hidden_mode_shift	0.557	0.443

5 LIMITATIONS

The evidence is synthetic. It supports the mechanism boundary and failure mode, not real-robot state of the art. Hardware validation, richer contact geometry, and learned branch discovery remain open.

6 CONCLUSION

Workspace Topology Change Detection argues that embodied world-action models should preserve unrealized physical alternatives when those alternatives change downstream action value.
